## **Draminski Ovulation Testimonials.**

We breed English Bulldogs and purchased the Dog Ovulation Detector almost a year ago, from PetTech Solutions, and we love it. It was the best investment that we could have made for our breeding program.

We were looking for an alternative to progesterone testing as the tests were getting costly and depending on the girl we were doing 4-7 tests in a heat cycle. While doing some research online we came across the Dog Ovulation Detector which seemed too good to be true. We discussed it and decided that we had done more than enough progesterone tests and that it was worth giving it a try as we had nothing to lose.

We purchased the Dog Ovulation Detector with some skepticism as to whether it would actually work or not. We decided that we were going to use the Ovulation Detector in conjunction with progesterone tests and compare the end results just to put our own minds at ease.

Our first girl came into heat and we used the probe just as the manual had said and we charted the numbers. We would take her number just prior to going to bed at night and every morning first thing when we got up. We took her number one night and her number was still going up, when we woke the next morning her number had dropped drastically. She had peaked that night. So according to what we were reading and understanding from the instructions, optimal breeding would be within 24-48 hours, so we bred her right around the 48-hour mark. However, being skeptical we also did progesterone testing and low and behold the results aligned completely with the Dog Ovulation Detector.

We have now bred four girls in our breeding program using the Dog Ovulation Detector and have had four successful pregnancies! We compared three of them to progesterone tests and all three of them lined up with the test results. The fourth fell over Christmas when we could not have a progesterone test done, so we put our faith solely in the Ovulation Detector and just confirmed that she is

pregnant.

We are so happy with our decision to purchase the Dog Ovulation Detector as it is convenient, and affordable and so easy to use. Our girl over Christmas would have been missed completely if it wasn't for the convenience of the Ovulation Detector at home. We have full faith in the Dog Ovulation Detector going forward and would recommend it to any breeder.”

### **Brandy Wells, MBM Bulldogs**

We have used the detector once and as we also have a very experienced stud dog it was interesting to see how he related in his reaction to the data we were getting from the meter.

The detector and the stud dog were completely in sync, as we were taking the bitch to a dog outside our yard this allowed us to time the mating very accurately and got 5 pups from the single tie.

I have and will continue to recommend the detector to breeders and will be assisting a few breeders with some bitches that have in the past been very difficult to time their matings.

### **Ken Cox**

I purchased both the Draminski Ovulation Detector & the Pregnancy Detector from you early last year 2015.

Both these tools have been of great value to my Breeding Kennels.

Each bitch is tested daily that is in oestrus & one bitch I would have missed who ovulated at day 6!!!

## Advanced Farm Systems

Another never peaked until late in her cycle & if bred on the norm of day 12 then she would have been missed.

It's also been great to know when to travel to the Stud Dog at the right time.

Having small dogs it is easy to put them onto my grooming table & reward them with a treat each time. They are very smart dogs & have it all worked out of the produce by day 3 & turn themselves around whilst I do the reading.

The product has more than paid itself off already. And I'm pleased to say I wouldn't have some of the lovely puppies on the ground now if I didn't have the Ovulation Detector.

The pregnancy Detector has also been great to use. And I use it on both my dogs & sheep.

It's helped with knowing if my bitches are in whelp prior to export or just for knowing if we are expecting puppies or not.

### **Anita-kaye Malby**

I have bitches that ovulate early & 'go over' very quickly, which the detector showed me. I have been trying time and again to get them into pup and failed, but with the unit, I have now succeeded and achieved fantastic litters. I have recommended you to so many people.

### **DAWN BLISS (ELVISTIME PAPILLONS)**

I bought my Draminski from someone who was giving up breeding. I decided it would be a better long-term investment than getting blood tests at the vets. The first Lhasa bitch I tried it on has silent seasons and never swells much. The Draminski indicated she was ready way before I would have expected her to be ready and I did wonder if I was not using it correctly. However acting upon the readings, I walked into the stud dog's house and he mated her within a few minutes. She had 5 pups. The second time of use, on an Irish Wolfhound, I was

also spot on when I visited the stud dog. It is so much easier for myself, my bitches and the stud dog owners if I can be sure of the right day for mating. It saves money on petrol, saves valuable time and also relieves us all from the stress of worrying about not missing ovulation or whether the bitch is ready or gone over. Worth its weight in gold !!!

**JANE PARADISE** (SHARDLOW)

Previously spent \$2500 on testing with no pups at all !!! One Bulldog bitch missed 9 times in a row and the other bitch (with a double entry to the cervix) missed 6 times in a row, but with the Draminski Ovulation Detector I got a litter of 5 and 4 at the first attempt !!! It is easy to use and the results are absolutely astonishing after so much wasted time, and money before. I have already started telling everyone about it.
